Abst Journal: Referat Zhur - Khimiya, No 19, 1956, 61035

Abstract: temperature in pure liquids as well as in all the investigated mixtures, whereas the classical theory which does not take into account the volumetric viscosity  $\eta'$  leads to the inverse temperature dependence. In all instances the determined  $\alpha/\nu^2$  values exceed those calculated in accordance with the classical theory. Nature of change in  $(\alpha/\nu^2)$  (experimental) and  $(\alpha/\nu^2)$  (theoretical) with concentration is not the same. The observations are in good agreement with calculated absorptions (deviations do not exceed 6-8%) in accordance with the relaxation theory (Pinkerton, J. M., Proc. Phys. Soc., 1949, B-62, 126-141). In the region of low temperatures agreement between theory and experiment is somewhat better than in the region of high temperatures. On the basis of data on sound absorption there have been calculated the values of the coefficient of volumetric viscosity  $\eta'$ . According to experimental data  $\eta'$  changes with temperature the same as  $\alpha$ . Dependencies of  $\eta$  and  $\eta'$  upon concentration are different. There is presented a short review of investigations of the absorption of US in liquid binary mixtures.

✓ Relation between the propagation velocity of the ultrasonic waves and the temperature and concentration in mixtures of normal organic liquids. N. A. Dmitrieva  
Gidrosvyaz Press, Moscow, Zash. Pis. Akad. Nauk SSSR, No. 1727-3 (1953).

The measurements were made by an optical method, based on light diffraction on the ultrasound grating in a liquid. The arrangement permitted ultrasound-velocity measurements with an error of  $\pm 2\%$ , at  $-70^\circ$  to  $+100^\circ$ . When the pure components of the mixtures follow the law of corresponding states, their mixtures do also. In all other cases, when either one or both components deviate from the law of corresponding states, so do their mixtures. In these cases anomalies are met in the relation between the sound velocity and the adiabatic compressibility with the compn.

TITLE: Study of the Physical and Chemical Properties of Aqueous Solutions of Dimethylformamide by the Ultrasonic and Other Methods in the 20° to 90°C Range

PERIODICAL: V sb.: Primeneniye ul'traakust. k issled. veshchestva, Nr 7, Moscow, 1958, pp 75 - 90

ABSTRACT: The authors submit the results of measuring the velocity of propagation and the molar velocity of ultrasonic waves, as well as the density, adiabatic compressibility, viscosity, surface tension, and refractive index in aqueous solutions of dimethylformamide (D) at concentrations ranging from 0% to 100% (at 10% intervals) and at various temperatures. The data are presented in the form of tables and curves. At 20°C the ultrasonic velocity passes through a maximum at a concentration of 50 wt %, the density up to a concentration of 60 wt % is close to that of pure water, the adiabatic compressibility of D solutions passes through a minimum at a concentration of 50 wt %, the viscosity shows

TITLE: Use of Ultrasonic Waves to Dye Polyaacrylonitrile "Nitron" Fiber

PERIODICAL: V sb.: Primeneniye ul'traakust. k issled. veshchestva. Nr 7, Moscow, 1958, pp 161 - 167

ABSTRACT: The authors report on the results of using ultrasonic waves (US) to dye polyacrylonitrile "nitron" fiber. It was established that the dry fiber is rapidly and permanently dyed with the aid of the dispersed dyes for acetate silk by a method involving the combined use of US and accelerants. The preliminary dispersing of the dye by means of US tells favorably on the dyeing rate and the utilization of the dye; in this connection it is more advantageous to use lower frequencies. Using US in conjunction with an accelerator (aniline) cuts the dyeing time in half as compared with the case of using the accelerator alone. The emulsions prepared under the influence of US yield better results. (Kalininskiy ped. in-t, USSR).

PAN are degraded while those of acetylcellulose remain unchanged. This fact is explained by the strength of chemical bonds within the polymer structure between the polymer molecule and the side-groups. The kinetics of the degradation process of PAN have been studied. It is shown that the depolymerization process follows the 1st order reaction and that long chain molecules are degraded first. The results are shown in the form of graphs. 22 references.

TOPIC TAGS: ultrasound absorption, acoustic speed, epoxy plastic, rubber, butyl  
rubber, acoustic measurement, thermostat, ACOUSTIC PROPERTY

ABSTRACT: The speed and absorption of ultrasound were measured at frequencies 500 kcs  
- 10 Mcs in the following polymer materials: polybutylmethacrylate, compounds based  
on epoxy resin or the product of copolymerization of butylmethacrylate with dimethyl-  
acrylate-triethylene glycol, and others, in the temperature range -60 - +60C. A block  
diagram of the pulse apparatus is given. The speed measurement was based on the re-  
lative displacement of the first half-wave on the oscilloscope screen for two samples  
made of the same material but having different lengths. In determining the absorption,  
the amplitudes of the first half-wave were compared after passage through samples of  
different lengths of the given material. The method of multiple reflections was also  
used. A schematic diagram of the measuring chamber is presented. The entire system  
was immersed in a Dewar vessel filled with a liquid which did not react with the in-  
vestigated polymer. To obtain low temperatures, refrigerating apparatus was used in

Card 1/2

L 32991-66

ACC NR: AR6016271

conjunction with an ultrathermostat of the "Wobzer" type (accuracy 0.05C). Curves showing the dependence of  $\alpha$  and of the ultrasound velocity on the temperature at 830 and 980 kcs and at 2 Mcs were obtained. The temperature at which the temperature coefficients of the velocity change, exhibit no reciprocal proportionality to the temperature within the limits of experimental accuracy (1%) in the interval 800 kcs - 2 Mcs. The ultrasound speed in rubber decreases rapidly in the interval -40 - 10C, while the absorption in the region -30 - 20C passes through a maximum (transition from the highly-elastic into the glass-like state). At higher frequencies, the absorption maximum shifts toward lower temperatures. I. Nikolayeva. [Translation of abstract]

B

SOURCE: Ref. zh. Khimiya, Part II, Abs. 7S65

REF SOURCE: Sb. Primeneniye ul'traakust. k issled. veshchestva. Vyp. 20. M., 1964, 47-53

TOPIC TAGS: ultrasound absorption, ultrasonic velocity, rubber, acoustic property

ABSTRACT: The pulse method was used to study the velocity  $V$  and absorption  $\alpha$  of ultrasound in polymeric materials: polybutyl methacrylate, compounds prepared from ED-515 epoxy resin, compounds based on the product of copolymerization of butyl methacrylate with triethylene glycol dimethacrylate, and resins based on BK, SKN, and NK in the range of -60 to +60°. A block diagram of the device employed is given. The temperature dependences of  $\alpha$  and  $V$  at frequencies of 830, 980, and 2 Mc were obtained. It was found that the velocity of the ultrasound in the rubbers decreases markedly in the range of -40 to +10°, and the absorption in the range of -30 to 20° passes through a maximum (transition from a high-elastic to a vitreous state). At higher frequencies, the absorption maximum shifts toward lower temperatures. N. Nikolayeva. [Translation of abstract]

TITLE: Manufacture and properties of sintered filters

SOURCE: Poroshkovaya metallurgiya, no. 3, 1963, 52-62

TOPIC TAGS: sintered filter, spherical metallic powder, inert filler, Fe, Ni, Cu, bronze, phosphorus, strength, permeability, porosity particle size

ABSTRACT: The authors investigated the method of producing sintered filters by melting metallic powder mixed with an inert filler. This mixture was heated to 373-423K above the melting temperature of the metal. Spherical powders of iron, nickel, copper and bronze were prepared by this method. Carbon black was used as a filler in processing iron powder; calcium carbonate was used with nickel powder. The best temperature for melting nickel was 1823K; for bronze, 1223K; and for copper, 1473K. Activated sintering improves the strength of products and preserves their permeability. The strength of the filters was also increased by adding ammonium phosphate, cuprous chloride and tin to the metallic powders, and became much higher than that of filters made of paper, carton, or fabric. Permeability and filtration ability of sintered filters are

Card 1/2

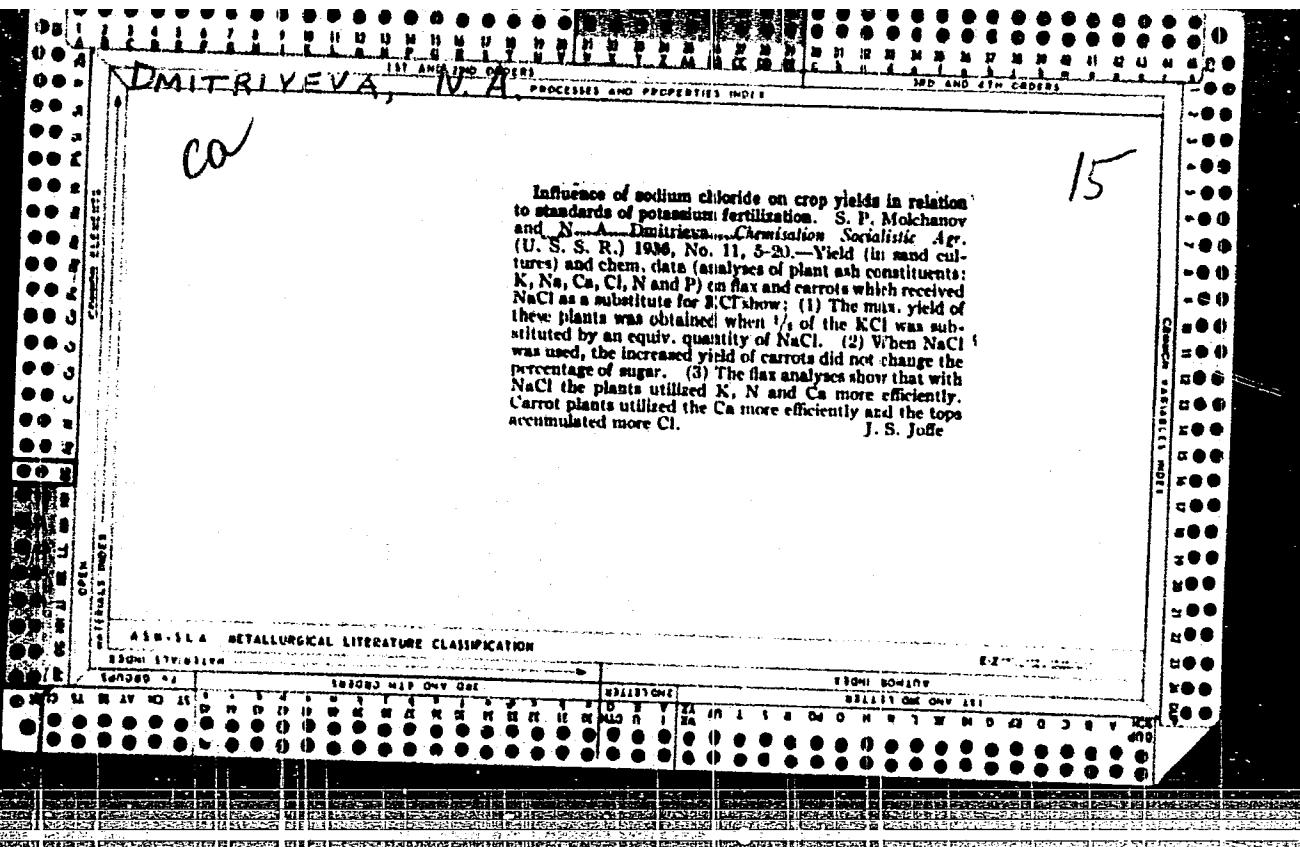

L 12887-63  
ACCESSION NR:APJOD1953

determined by the shape and size of the particles from which the filters are made. Filters with 35-40% porosity are most effective. The change of particle size from 45 to 250-450 Microns raises the permeability up to 10 times. The described method for obtaining spherical powders is recommended as equal to the method of metal pulverization. Sintered filters of various permeabilities, particle sizes, porosities, and thicknesses may be selected for different working requirements. Orig. art. has: 13 figures and 1 table.

Abstract: largest yield boost, when winter wheat was side-dressed in autumn, was gotten from Na. In the 1955 test under dry autumn conditions the nitrogen fertilizers, regardless of their form, brought in equally good increases in the harvest. Spring side-dressing was more effective than the fall dressing. The largest yield boost was obtained from calcium ammonium nitrate. The presence of calcium improved the plant up-take of ammonium nitrate. The combination of calcium with nitrate nitrogen does not give the same effect, inasmuch as the latter is easily washed away. -- V. D. Astaf'yeva

✓ Increasing glycerol yields. R. I. Slobin, N. A. Kaminer, N. A. Umnitskaya, and M. S. Pashnik, *Moskovskaya Promst. Prog.*, No. 1, 59-7(1957).—High-pressure steam method of hydrolysis of fats without the use of catalysts produce glycerol water with fatty-acid(f) contents up to 0.8% in the form of static emulsions. Reactions of oil with lime catalyst that used for example in the production of soaps are not recommended because of their quinolysis. The emulsion is separated from the glycerol by centrifugation, and the glycerol is dried over calcium oxide and vacuum distilled. The yield of glycerol is 80-85%. An example of the process is given below. The oil is heated to 100°, after which the lime is added. After separation of the product is filtered and the calcium oxide is washed off with acetone.

SOV/78-3-9-2/38  
Preparation and Properties of Plutonium Halides. I. On Plutonium Chlorides

chloride at 70-100°C in the air, a compound is separated in which the ratio Pu : Cl is 2 : 3. In vacuum this compound separates water and oxygen. The possibilities of preparing plutonium-III-chloride by thermodynamical methods were discussed. In the chlorination of plutonium oxide in the presence of rubidium chloride a red-orange substance is formed. The adsorption spectrum of this compound indicates the presence of the Pu-IV-ion in solution. This experiment demonstrates that the preparation of complex chloride of tetravalent plutonium by the dry method is possible. There are 1 figure, 5 tables, and 12 references, 4 of which are Soviet.

TITLE: δ-Lactones (δ-laktony). 3-Bromopyrones-2 (3-bromopyrone-2)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 3,  
pp 589 - 590 (USSR)

ABSTRACT: As is known (Refs 1-4), the bromination of the pyrones-2 leads to a formation of 3-substituted pyrones. The authors produced a number of 3-bromopyrones-2 (not described in publications) from 5,6-dialkyl-pyrone-2 and from 5,6-cycloalcane-pyrone-2. They were synthesized by the method (Refs 5,6) previously developed by the authors. The yield amounted to 28-56%. 3-bromine-5,6-dimethylpyrone-2 (I), 3-bromine-5-ethyl-6-methylpyrone-2 (II), 3-bromine-5,6-cyclopentane-pyrone-2 (III) and 3-bromine-5,6-cyclohexane-pyrone-2 (IV) were produced. It was first found out that the 3-bromopyrones-2 - like the pyrones-2 themselves - easily undergo the reaction of the diene synthesis with the maleic acid anhydride. They form double adducts (V-VIII) with a 50-80% yield. These correspond to the addition of 2 molecules of maleic acid anhydride in the bromopyrone molecule (see Scheme). Table 1 shows the constants, yields and analytic

TITLE: The use of radiomimetic (erythrocytic) models for studying  
the potential radioprotectors of the thiazolidine group

SOURCE: Radiobiologiya, v. 4, no. 4, 1964, 632-637

TOPIC TAGS: radiation protection, radiomimetic model, thiazolidine,  
oleinic acid, erythrocyte

ABSTRACT: Thiazolidine derivatives in 0.02-M concentrations were selected as potential radioprotective agents. In each test, the comparative effectiveness of mercamine on irradiated human erythrocytes was studied. Oxidized oleinic acid with standard toxicity was employed as the radiomimetic agent. Preparation of the solutions and their addition to the erythrocytes took place immediately before the tests. It was determined that oleinic acid destroyed half the erythrocytes in 1.5—2.0 minutes. The hemolytic activity of oleinic acid was established after erythrocytes were washed in a potassium

Card 1/2

ACCESSION NR: AP4043219

hydroxide bath (0.05 M) and a phosphate buffer (pH 7) was added. The effectiveness of potential radioprotectors was evaluated as a function of decreased hemolysis rate. The comparative ability of compounds to protect against the effects of oleinic acid was established by irradiating the erythrocytes with gamma rays from a GUT-Co-400 in 100—1000-kr doses. The criterion for erythrocyte damage under these conditions was the time it took to destroy half of them with respect to the controls. It was found that thiazolidine derivatives exerted a protective influence against the effects of gamma radiation and oleinic acid and that the mechanism of this influence depended upon the character of the radicals in the displacement of hydrogen atoms. The authors conclude that radiomimetic models can be employed for preliminary evaluation of aminothiole-type radioprotectors or those compounds which possess the ability to form aminothiols. Title : Determining flow gradients by data on water levels and discharge volume

Periodical : Met. i Gidro., 3, 36-40, My-Je 1955

Abstract : The author establishes the relation between the draft capacity and the water levels for a lengthy period and presents a theoretical computation of the flow gradient taking into consideration all pertinent factors, such as discharge volume at different seasons, precipitation, etc. This method was first used to gage certain Don River sections. One table, 2 diagrams.

PURPOSE: This work is intended for meteorologists, hydrologists, and hydrogeologists, particularly those engaged in the study of snow and ice and evaporation processes.

COVERAGE: This book contains papers on hydrophysics which were presented and discussed at the Third All-Union Hydrological Conference in Leningrad, October 1957. The Conference published 10 volumes on various aspects of hydrology of which this is number 3. The editorial board in charge of the series includes: V.A. Urzavaev (Chairman), O.A. Alekseev, Ye.V. Bliznyak (deceased), O.M. Borodin, Kritskiy, B.I. Dzhulin, L. Manoza, M.P. Menkashvili, B.P. Olin, I.V. Popov, A.M. Proskuryakov, D.L. Sobolovskiy, O.A. Stepanov, A.I. Chubarev, and S.K. Cherkashev. This volume is divided into 2 sections. The first contains reports from the subsections for the study of evaporation processes, and the second contains reports from the snow and ice subsection. References accompany each article.

Potentiometric Determination of Manganese in Ferro-Vanadium and Vanadium-Rich Steels. A. I. Busen and N. I. Dmitrieva. [Zarodokya Laboratoriya, 1950, No. 1, 29-31]. An analytical method is described for preparing materials containing over 0.3% of vanadium for the potentiometric determination of manganese. Manganese is precipitated as the dioxide from a solution of approx. 1 g. of sample. The precipitate is dissolved, and non-compensated potentiometric titration is carried out after the addition of sodium pyrophosphate and the careful establishment of the appropriate pH. Typical results are given, and these agree well with those of other methods.—S. K.
